PAGING REMOTE DISCONNECT SYSTEMS

Abstract

A wireless remote control system within a power supply or telecommunications module. A user simply plugs the power cord or telecommunication line of their device, such as a computer or appliance, into the outlet of the module. The user is then able to dial a pager number that is already pre-programmed. The paging service then transmits a signal to a radio frequency ("RF") receiver in the module. The signal is then decoded and sent to a processor. The processor then causes a relay to open or close in accordance with the decoded signal to activate the power supply or to turn the power off to the electronic device or to connect or disconnect the telecommunications line.
